Title : The improvement of the Production and Preservation of Diagnostic Sera for Plant Viruses.

Orig Pub : Za Sots. S.-Kh. Nauku, 1957, A6, No 4, 333-342

Abstract : From 970 ml of unpurified juice of tobacco leaves infected with the potato virus, 2 gm of antigen were obtained by means of lyophilic dessication to a powder state. The lyophilized antigen was preserved as a powder in the refrigerator, without deterioration in its quality, for a much longer period of time than the liquid serum.

Title : An investigation of the chemotherapeutic characteristics of biomycin
in Experimental typhoid fever cases

Periodical : Zhur. mikrobiol. epid. i immun., 6, 3-6, Jun 54

Abstract : White mice were experimentally enfeeted with typhoid pneumonia. They were treated per os with various doses of a water suspension of biomycin. The biomycin had a definite antibiotic effect on the treated animals. It brought about a decrease in the severity and distribution of patho-morphological changes occurring in the lungs of the mice, and suppressed the reproduction of the typhoid bacilli. Its action, however, was not complete since the typhoid microorganisms could still be cultured from the treated animals' organs even after 30-40 days. The results of the experiments are presented on two charts. No references are cited.

VERMOL'YEVA, L. V.

In a brief article entitled "Globisporin," Z. V. Vermol'yeva describes the new antibiotic globisporin derived by N. A. Erusli'nikov from the strain of the ray fungus *Actinomyces globisporus* which was isolated by him. An investigation of the antibacterial properties of the new antibiotic indicated that the spectrum of its action does not differ from the antibacterial spectrum of streptomycin. It has been successfully applied in the therapy of pulmonary and other forms of tuberculosis. The calcium chloride complex of globisporin has been found to be highly effective in the therapy of tubercular meningitis. It is administered to adults intramuscularly in doses of one gram in 24 hours, either in single or double administrations. Like streptomycin, it may produce side effects. According to A. Ia. Rabukhin, however, these side effects are not as frequent nor as strongly expressed as those produced by streptomycin. In cases in which the patient does not tolerate streptomycin, globisporin may be successfully applied. (Streptomycin [Streptomycin], Medgiz, Moscow, 1956, pp 39-40) (U)

YERMOL'YEVA, Z. V.

"Determination of the Concentration of Biowycin in Blood Serum,"
by A. I. Semich and M. A. Petrova, All-Union Scientific Re-
search Institute of Antibiotics, Biomitsin (Biowycin), edited
by Prof Z. V. Yermol'yeva, Corresponding Member, Academy of
Medical Sciences USSR, and Prof A. F. Bilibin, Corresponding
Member, Academy of Medical Sciences USSR, Moscow, Medgiz, 1956,
pp 43-45

The author developed a method for the quantitative determination of
biowycin in blood serum. Meat-peptone broth with a pH of 6.8-7.0 was used
as a nutrient medium and the soil bacillus L₂ (spore forming) was used
as a test microbe. The proposed method produces good results and may be
used in the clinic. (U)

ANTIBIOTICS

"The Problems of Antibiotics," by Professor Z. Yermol'yeva, Chairman of the Committee of Antibiotics of the Scientific Medical Council of the Ministry of Health USSR, Meditsinskiy Rabotnik, 24 May 1957, p 2.

This article, published on the occasion of the Second All-Union Conference of Antibiotics, deals with the progress made in the Soviet Union in the field of antibiotics. The author reports that, at the First Conference, only 60 papers were presented, while at the Second Conference, over 250 were scheduled.

The All-Union Institute of Antibiotics of the Ministry of Health USSR concentrates on technological problems. It studies the microorganisms producing antibiotics, perfects methods of production, and develops new preparations.

The Institute for the Search of New Antibiotics of the Academy of Sciences USSR, has as its task the development of new antibacterial, antiviral, and anticancerous preparations.
